

June 1, 2006

By choosing to live in Tradition, you will be in one of the *most technologically advanced communities in the country*.

The Home Town Cable Plus System in Tradition uses a state-of-the-art fiber optic technology that transmits direct to your home video, High-Speed Internet, alarm monitoring and telephone. There are no unsightly cable TV pedestals in front of your home like you'll see with traditional cable service, and, *most importantly*, the bandwidth for High-Speed Internet is many times that of a traditional Internet provider as the signals travel 100% via fiber to your home. Older cable systems with pedestals use coax cable which limits bandwidth.

Home Town is *one of the first* companies in the country to provide a fiber-to-the-home service. What this means for you is that Home Town will soon be able to provide you with an array of services unlike that offered by traditional cable or satellite operators.

What is most unique about the technology of Home Town is that it is an *IP-based system (IPTV)*. What this means is that our services are sent to you through fiber with lasers via computer technology and you don't need a modem to connect to the Internet.

#### **HDTV**

- (i) Our HD will have much better picture quality than satellite HD. Satellite does not offer a true HD; it is referred to by some in the industry as HD-Lite.
  
- (ii) More and more channels are launching HD every month. HD takes up more bandwidth than regular, non-HD video. Home Town's System has plenty of bandwidth while traditional cable operators will become bandwidth limited as more and more HD channels launch.

Note: Some services are launching soon.
